## Chapter 7 Linkage

## Introduction

Recombination fraction
Genetic map construction
Locating genes affecting traits
Distances Between Genes

- The recombination fraction $C_{A B}$ between loci $A$ and
$B$ is the probability that the gamete transmitted by an individual is recombinant
- Linkage parameter $\lambda_{A B}=1-2 C_{A B}, 0 \leq C_{A B} \leq \frac{1}{2}$

Physical distance $d_{A B}(k b)$
Genetic map distance $X_{A B}(c M)$
Haldanc map function (1919)

$$
\begin{aligned}
& C_{A B}=\frac{1}{2}\left(1-e^{-2 X_{A B}}\right) \\
& X_{A B}=-\frac{1}{2} \ln \left(1-2 C_{A B}\right)
\end{aligned}
$$

Kosambi map function (1944)

$$
X_{A B}=\frac{1}{4} \ln \left(\frac{1+2 C_{A B}}{1-2 C_{A B}}\right)
$$

## Estimation of Recombination

- Backcross method

Table7.1
Two-locus counts for a backcross. Each locus has two alleles, with one dominant to the other.

|  |  | Offspring |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Genotype | $\mathrm{AB} / \mathrm{ab}$ | $\mathrm{Ab} / \mathrm{ab}$ | $\mathrm{aB} / \mathrm{ab}$ | $\mathrm{ab} / \mathrm{ab}$ |  |
|  | Phenotype | AB | Ab | aB | ab | Total |
| Observed |  | $a$ | $b$ | $c$ | $d$ | $n$ |
| Expected |  | $\frac{n}{4}$ | $\frac{n}{4}$ | $\frac{n}{4}$ | $\frac{n}{4}$ | $n$ |

$$
\begin{aligned}
X_{A}^{2} & =\frac{(\mathrm{a}+\mathrm{b}-\mathrm{n} / 2)^{2}}{n / 2}+\frac{(\mathrm{c}+d-\mathrm{n} / 2)^{2}}{n / 2}=\frac{(\mathrm{a}+\mathrm{b}-\mathrm{c}-\mathrm{d})^{2}}{\mathrm{n}} \\
X_{B}^{2} & =\frac{(\mathrm{a}+c-\mathrm{b}-\mathrm{d})^{2}}{n} \\
X_{A B}^{2} & =\frac{(\mathrm{a}+\mathrm{d}-\mathrm{b}-\mathrm{c})^{2}}{n} \\
X^{2} & =\frac{(\mathrm{a}-\mathrm{n} / 4)^{2}}{\mathrm{n} / 4}+\frac{(\mathrm{b}-\mathrm{n} / 4)^{2}}{\mathrm{n} / 4}+\frac{(\mathrm{c}-\mathrm{n} / 4)^{2}}{\mathrm{n} / 4}+\frac{(\mathrm{d}-\mathrm{n} / 4)^{2}}{\mathrm{n} / 4} \\
& =X_{A}^{2}+X_{B}^{2}+X_{A B}^{2}
\end{aligned}
$$

Example: The maize data reported by Goodman et al (1980)

$$
\begin{aligned}
& \frac{E 12, U 4}{E 12, U 4} \frac{E 12, U 8}{E 12, U 4} \frac{E 15, U 4}{E 12, U 4} \frac{E 15, U 8}{E 12, U 4} \\
& 53 \\
& 13
\end{aligned} 9 \quad 55 .
$$

Table 7.2
Two-locus counts for a backcross for linked loci.

|  |  | Offspring |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Genotype | $\mathrm{AB} / \mathrm{ab}$ | $\mathrm{Ab} / \mathrm{ab}$ | $\mathrm{aB} / \mathrm{ab}$ | $\mathrm{ab} / \mathrm{ab}$ |  |
|  | Phenotype | AB | Ab | aB | ab | Total |
| Observed |  | $a$ | $b$ | $c$ | $d$ | $n$ |
| Expected |  | $\frac{n}{2}\left(1-c_{A B}\right)$ | $\frac{n}{2} c_{A B}$ | $\frac{n}{2} c_{A B}$ | $\frac{n}{2}\left(1-c_{A B}\right)$ | $n$ |

$$
\begin{aligned}
\hat{c} & =\min (\tilde{p}, 1-\tilde{p}) \\
L\left(c_{A B}\right) & \propto\left(1-c_{A B}\right)^{a+d}\left(c_{A B}\right)^{b+c} \\
S_{C A B}= & -\frac{a+d}{1-c_{A B}}+\frac{b+c}{c_{A B}}
\end{aligned}
$$

$$
\begin{aligned}
& I_{c A B}=\frac{n}{c_{A B}\left(1-c_{A B}\right)} \\
& \hat{c}_{A B}=\frac{b+c}{n} \\
& \operatorname{Var}\left(\hat{c}_{A B}\right)=\frac{c_{A B}\left(1-c_{A B}\right)}{n} \\
& \hat{c}=\min \left(\frac{b+c}{n}, 0.5\right)
\end{aligned}
$$

- $F_{2}$ population method: (homework)
- Direct method: Three-generation method

Figure 7.1 Three generation pedigree

- Lod scores with phase known (pg 238)

$$
\begin{aligned}
& Z(c)=\log \left[\frac{L(c)}{L(0.5)}\right] \\
& L(c) \propto(1-c) c^{3} \\
& Z(c)=\log \left[16(1-c) c^{3}\right]
\end{aligned}
$$

- Lod scores with phase unknown (pg 240)

## Genetic Map Construction

- By Haldane map function,

$$
C_{A C}=C_{A B}\left(1-C_{B C}\right)+\left(1-C_{A B}\right) C_{B C}
$$

- Sum of adjacent recom. fraction (sar)
- If the order of the loci $A, B, C$ was mistakenly believed to be $B, A, C$, then the sar under the wrong order would be calculated as $C_{A B}+C_{A C}$. From the relation derived under the true order,

$$
C_{A B}+C_{A C} \geq C_{A B}+C_{B C}
$$

The sar under the wrong order is not less than that under the correct order.

- Two problems with using the sar as a criterion for
determining the correct order for a set of loci
(pg 241).
- Seriation
- Simulated annealing
- Branch and bound
- Error detection

## Linkage Disequilibrium Mapping <br> Pedigree-based and population-based approaches. <br> Random sample

- Genotype data : pg 126
- Haplotype data :

## Conditional data

- Genotype data : Suppose a disease locus has alleles $N, D$ and a marker locus has two alleles $M_{1}, M_{2}$. In the whole population, the allele frequencies are $p_{N} p_{D}$ at the disease locus and $m_{1}, m_{2}$ at the marker locus. Allowing for the linkage disequilibrium $D$ between the loci, the four gametes have frequencies

$$
\begin{aligned}
& N M_{1}: y_{1}=p_{N} m_{1}+D \\
& N M_{2}: y_{2}=p_{N} m_{2}-D \\
& D M_{1}: y_{3}=p_{D} m_{1}-D \\
& D M_{2}: y_{4}=p_{D} m_{2}+D
\end{aligned}
$$

For a random-mating population, the conditional frequencies $a$ of marker allele $M_{1}$ in each of the three disease genotypic categories are

$$
a_{1}=\operatorname{Pr}\left(M_{1} \mid N N\right)=\frac{y_{1}^{2}+y_{1} y_{2}}{p_{N}^{2}}=m_{1}+\frac{D}{p_{N}}
$$

$$
\begin{aligned}
& a_{3}=\operatorname{Pr}\left(M_{1} \mid D D\right)=\frac{y_{3}^{2}+y_{3} y_{4}}{p_{D}^{2}}=m_{1}-\frac{D}{p_{D}} \\
& a_{2}=\operatorname{Pr}\left(M_{1} \mid N D\right)=\frac{y_{1} y_{4}+y_{2} y_{3}+2 y_{1} y_{3}}{2 p_{N} p_{D}} \\
& \quad=m_{1}+\frac{D}{2 p_{N}}-\frac{D}{2 p_{D}}=\frac{1}{2}\left(a_{1}+a_{3}\right) \\
& L\left(a_{1}, a_{3}\right)_{1} \propto\left(a_{1}\right)^{x_{1}}\left(1-a_{1}\right)^{2 n_{1}-x_{1}} \\
& L\left(a_{1}, a_{3}\right)_{2} \propto\left(a_{1} a_{3}\right)^{n_{21}}\left(a_{1}+a_{3}-2 a_{1} a_{3}\right)^{n_{22}}\left(1-a_{1}-a_{3}+a_{1} a_{3}\right)^{n_{23}} \\
& L\left(a_{1}, a_{3}\right)_{3} \propto\left(a_{3}\right)^{x_{3}}\left(1-a_{3}\right)^{2 n_{3}-x_{3}} \\
& \operatorname{Var}\left(\hat{a}_{1}\right)=\delta_{1} \beta_{1} \beta_{13} / \gamma \\
& \operatorname{Var}\left(\hat{a}_{3}\right)=\delta_{3} \beta_{3} \beta_{13} / \gamma \\
& \operatorname{Cov}\left(\hat{a}_{1}, \hat{a}_{3}\right)=-n_{2} \delta_{1} \beta_{1} \beta_{13} / \gamma \\
& \beta_{1}=a_{1}\left(1-a_{1}\right) \quad \beta_{3}=a_{3}\left(1-a_{3}\right) \\
& \beta_{13}=a_{1}+a_{3}-2 a_{1} a_{3} \\
& \delta_{1}=\beta_{13}\left(2 n_{3}+n_{2}\right)-n_{2} \beta_{1} \\
& \delta_{3}=\beta_{13}\left(2 n_{1}+n_{2}\right)-n_{2} \beta_{3} \\
& \gamma=\delta_{1} \delta_{3}-n_{2}^{2} \beta_{1} \beta_{3} \\
& \hat{m}_{1}=p_{N} \hat{a}_{1}+p_{D} \hat{a}_{3} \\
& \hat{D}=p_{N} p_{D}\left(\hat{a}_{1}-\hat{a}_{3}\right) \\
& \operatorname{Var}\left(\hat{m}_{1}\right)=p_{N}^{2} \operatorname{Var}\left(\hat{a}_{1}\right)+p_{D}^{2} \operatorname{Var}\left(\hat{a}_{3}\right)+2 p_{N} p_{D} \operatorname{Cov}\left(\hat{a}_{1}, \hat{a}_{3}\right) \\
& \operatorname{Var}(\hat{D})=p_{N}^{2} p_{D}^{2}\left[\operatorname{Var}\left(\hat{a}_{1}\right)+\operatorname{Var}\left(\hat{a}_{3}\right)-\operatorname{Cov}\left(\hat{a}_{1}, \hat{a}_{3}\right)\right]
\end{aligned}
$$

Yule's coefficient of association

- Haplotype data :

$$
\begin{aligned}
& a_{1}=\operatorname{Pr}\left(M_{1} \mid N\right)=\frac{\operatorname{Pr}\left(N M_{1}\right)}{\operatorname{Pr}(N)}=m_{1}+\frac{D}{p_{N}} \\
& a_{3}=\operatorname{Pr}\left(M_{1} \mid D\right)=\frac{\operatorname{Pr}\left(D M_{1}\right)}{\operatorname{Pr}(D)}=m_{1}-\frac{D}{p_{D}} \\
& \hat{m}_{1}=p_{N} \frac{n_{N 1}}{n_{N}}+p_{D} \frac{n_{D 1}}{n_{D}}=p_{N} \hat{a}_{1}+p_{D} \hat{a}_{3} \\
& \hat{D}=p_{N} p_{D}\left(\frac{n_{N 1}}{n_{N}}-\frac{n_{D 1}}{n_{D}}\right)=p_{N} p_{D}\left(\hat{a}_{1}-\hat{a}_{3}\right)
\end{aligned}
$$

- Heterozygote data :

## Other tests:

Case-Control test: The comparison of marker allele frequencies in samples of disease and normal genotypes or haplotypes is called case controlled test.

## - Mean Haplotype-sharing tests:

Affected sib-pair test : It considers the marker alleles received by two afftected children. If there is no linkage between disease and marker loci, the distribution of ibd alleles should have nothing to do with disease status.

Table 7.7 Observed and expected frequencies for four haplotypes when only heterozygotes at a disease locus are available.

|  | $M_{1}$ |  |  |  | $M_{2}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $N$ | Exp. | Obs. |  | Exp. | Obs. | Total |
| $N$ | $\frac{1}{2} a_{1}$ | $\frac{1}{2 n_{2}}\left(n_{21}+n_{22}^{c}\right)$ |  | $\frac{1}{2}\left(1-a_{1}\right)$ | $\frac{1}{2 n_{2}}\left(n_{23}+n_{22}^{r}\right)$ | $\frac{1}{2}$ |
|  | $\frac{1}{2} a_{3}$ | $\frac{1}{2 n_{2}}\left(n_{21}+n_{22}^{r}\right)$ |  | $\frac{1}{2}\left(1-a_{3}\right)$ | $\frac{1}{2 n_{2}}\left(n_{23}+n_{22}^{c}\right)$ | $\frac{1}{2}$ |
|  | $a_{2}$ | $\frac{1}{2 n_{2}}\left(2 n_{21}+n_{22}\right)$ |  | $1-a_{2}$ | $\frac{1}{2 n_{2}}\left(2 n_{23}+n_{22}\right)$ | 1 |

## - Transmission disequilibrium test:

Table 7.8 Genotypes and transmitted gametes for heterozygous markers.

|  |  | Probability of |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Genotype | Frequency |  | $T: M_{1} D$ | $T: M_{1} D$ | $T: M_{2} D$ | $T: M_{2} D$ |  |
|  |  | $D$ | $N T: M_{1}$ | $N T: M_{2}$ | $N T: M_{1}$ | $N T: M_{2}$ |  |
| $M_{1} D / M_{1} D$ | $\operatorname{Pr}\left(M_{1} D\right)^{2}$ | 1 | 1 | 0 | 0 | 0 |  |
| $M_{1} D / M_{1} N$ | $2 \operatorname{Pr}\left(M_{1} D\right) \operatorname{Pr}\left(M_{1} N\right)$ | $1 / 2$ | $1 / 2$ | 0 | 0 | 0 |  |
| $M_{1} N / M_{1} N$ | $\operatorname{Pr}\left(M_{1} N\right)^{2}$ | 0 | 0 | 0 | 0 | 0 |  |
|  |  |  |  |  |  |  |  |
| $M_{1} D / M_{2} D$ | $2 \operatorname{Pr}\left(M_{1} D\right) \operatorname{Pr}\left(M_{2} D\right)$ | 1 | 0 | $1 / 2$ | $1 / 2$ | 0 |  |
| $M_{1} D / M_{2} N$ | $2 \operatorname{Pr}\left(M_{1} D\right) \operatorname{Pr}\left(M_{2} N\right)$ | $1 / 2$ | 0 | $(1-c) / 2$ | $c / 2$ | 0 |  |
| $M_{1} N / M_{2} D$ | $2 \operatorname{Pr}\left(M_{1} N\right) \operatorname{Pr}\left(M_{2} D\right)$ | $1 / 2$ | 0 | $c / 2$ | $(1-c) / 2$ | 0 |  |
| $M_{1} N / M_{2} N$ | $2 \operatorname{Pr}\left(M_{1} N\right) \operatorname{Pr}\left(M_{2} N\right)$ | 0 | 0 | 0 | 0 | 0 |  |
| $M_{2} D / M_{2} D$ | $\operatorname{Pr}\left(M_{2} D\right)^{2}$ | 1 | 0 | 0 | 0 | 1 |  |
| $M_{2} D / M_{2} N$ | $2 \operatorname{Pr}\left(M_{2} D\right) \operatorname{Pr}\left(M_{2} N\right)$ | $1 / 2$ | 0 | 0 | 0 | $1 / 2$ |  |
| $M_{2} N / M_{2} N$ | $\operatorname{Pr}\left(M_{2} N\right)^{2}$ | 0 | 0 | 0 | 0 | 0 |  |
|  |  |  |  |  |  |  |  |

$\operatorname{Pr}\left(M_{1} D\right)=p m+D$
$\operatorname{Pr}\left(T: M_{1}, N T: M_{1} \mid T: D\right)=m^{2}+m D / p$
$\operatorname{Pr}\left(T: M_{1}, N T: M_{2} \mid T: D\right)=m(1-m)+(1-c-m) D / p$
$\operatorname{Pr}\left(T: M_{2}, N T: M_{1} \mid T: D\right)=m(1-m)+(c-m) D / p$
$\operatorname{Pr}\left(T: M_{2}, N T: M_{2} \mid T: D\right)=(1-m)^{2}-(1-m) D / p$
$\operatorname{Pr}\left(T: M_{1}, N T: M_{2} \mid M_{1} M_{2}, T: D\right)=\frac{1}{2}+\frac{(1-2 c) D}{2[2 m(1-m) p+D(1-2 m)]}$
$\operatorname{Pr}\left(T: M_{2}, N T: M_{2} \mid M_{1} M_{2}, T: D\right)=\frac{1}{2}-\frac{(1-2 c) D}{2[2 m(1-m) p+D(1-2 m)]}$

## - Population admixture

$$
\begin{aligned}
p_{D M_{I}}= & p_{D_{I}} p_{M_{I}} \\
p_{D M_{I I}}= & p_{D_{I I}} p_{M_{I I}} \\
p_{D M}= & \alpha p_{D M_{I}}+(1-\alpha) p_{D M_{I I}} \\
= & {\left[\alpha p_{D_{I}}+(1-\alpha) p_{D_{I I}}\right]\left[\alpha p_{M_{I}}+(1-\alpha) p_{M_{I I}}\right] } \\
& +\alpha(1-\alpha)\left(p_{D_{I}}-p_{D_{I I}}\right)\left(p_{M_{I}}-p_{m_{I I}}\right) \\
= & p_{D} p_{M}+\alpha(1-\alpha)\left(p_{D_{I}}-p_{D_{I I}}\right)\left(p_{M_{I}}-p_{m_{I I}}\right)
\end{aligned}
$$

- Estimating marker-disease distances
- Old disease : When the disease mutation has been present in the population for a long time, the amount of linkage disequilibuium even to nearby markers is expected to be zero.

$$
\begin{aligned}
& r^{2}=\frac{\hat{D}^{2}}{\hat{p}_{N} \hat{p}_{D} \hat{m}_{1} \hat{m}_{2}}=\frac{X^{2}}{n} \\
& E\left(r^{2}\right)=\frac{1}{1+4 \mathrm{NC}}
\end{aligned}
$$

- Young disease : For young disease, chromosome carrying the disease allele are also likely to carry the marker allele that was present on the chromosome(s) on which the disease mutation occurred.

$$
p_{D_{i}}=\alpha \operatorname{Pr}(\text { no recom. })+[1-\alpha \operatorname{Pr}(\text { no recom. })] p_{N_{i}}
$$

## Homework:

1. Page 236: The $F_{2}$ individuals will fall into four recognizable classes when there is dominance at both loci. (a) verify Table 7.4 (b) show that the likelihood of $C_{A B} \propto(2+\theta)^{a}(1-\theta)^{b+c}(\theta)^{d}$ (c) verify $S(\theta), I(\theta), \hat{c}_{A B}$ and $\operatorname{Var}\left(\hat{c}_{A B}\right)$.
2. Page 240: If the parents are double heterozygotes of unknown phase, verify $\operatorname{Pr}($ type I child), $\operatorname{Pr}($ two type I children), Z (c) of two type II children, Z(c) for two independent families, one with two type I children and one with one of each type of child.
