摘要

This lecture gives a broad overview about the common views of the possible impacts of AI and how can we brace or even thrive on such impacts. It consists of three parts. In the first part, I will review three common attitudes toward the current development of AI. In the second part, I will elicit various precedents in history about how changes in technology, natural and social conditions transformed the world in unanticipated fashions, and how human beings reacted to such changes. In the third part, I will speculate how AI can alter many aspects of human beings and how shall we handle these transformations in terms of the precedents.
