Supplementary Materials

Supplemental materials contain the technical proofs of Theorems 1-3 in this paper and the additional simulation studies of the BRWB method.

A. Technical Proofs

Let $\{u_i(\tau), \tau \in [0,1]\}_{i=1}^{\infty}$ be a sequence of orthonormal basis of the Hilbert space $L^2[0,1]$. Then $\{u_j(\tau_1)u_l(\tau_2), \tau_1, \tau_2 \in [0,1]\}_{j,l=1}^{\infty}$ forms a sequence of basis in $L^2([0,1]^2)$. Define $X_{t,j} = \langle X_t, u_j \rangle$, and define the space $\mathbb{H}_1$ as

$$\mathbb{H}_1 \equiv \left\{ f : [0,1]^2 \mapsto \mathbb{R}^K \Big| \iint f(\tau_1,\tau_2)^{\mathrm{T}} f(\tau_1,\tau_2) d\tau_1 d\tau_2 < \infty \right\}.$$

This space is a separable Hilbert space equipped with the inner product

$$\langle f, g \rangle_{\mathbb{H}_1} = \iint f(\tau_1,\tau_2)^{\mathrm{T}} g(\tau_1,\tau_2) d\tau_1 d\tau_2, \quad \forall f, g \in \mathbb{H}_1.$$

Let $\|\cdot\|_{\mathbb{H}_1}$ denote the norm induced by this inner product.

Without loss of generality, we assume that $\mathrm{E}(X_t)=0$ and define the following notations:

$$\begin{aligned}
\boldsymbol{X}_{t,K}(\tau_1,\tau_2) &= \big(X_t(\tau_1)X_{t-1}(\tau_2)-\mathrm{E}(X_t(\tau_1)X_{t-1}(\tau_2)),\ldots,X_t(\tau_1)X_{t-K}(\tau_2)-\mathrm{E}(X_t(\tau_1)X_{t-K}(\tau_2))\big)^{\mathrm{T}},\\
\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2) &= \big(\hat{\gamma}_1(\tau_1,\tau_2)-\gamma_1(\tau_1,\tau_2),\ldots,\hat{\gamma}_K(\tau_1,\tau_2)-\gamma_K(\tau_1,\tau_2)\big)^{\mathrm{T}},\\
\boldsymbol{X}_{t,K,j,l} &= \big(X_{t,j}X_{t-1,l}-\mathrm{E}(X_{t,j}X_{t-1,l}),\ldots,X_{t,j}X_{t-K,l}-\mathrm{E}(X_{t,j}X_{t-K,l})\big)^{\mathrm{T}},\\
\hat{\boldsymbol{\gamma}}_{K,j,l} &= \Big(\frac{1}{T}\sum_{t=2}^{T}\big(X_{t,j}X_{t-1,l}-\mathrm{E}(X_{t,j}X_{t-1,l})\big),\ldots,\frac{1}{T}\sum_{t=K+1}^{T}\big(X_{t,j}X_{t-K,l}-\mathrm{E}(X_{t,j}X_{t-K,l})\big)\Big)^{\mathrm{T}},
\end{aligned}$$

where $\gamma_h(\tau_1,\tau_2)$ and $\hat{\gamma}_h(\tau_1,\tau_2)$ are defined in (2.2) and (2.4) respectively. Obviously,

$$\begin{aligned}
\sqrt{T}\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2) &= \frac{1}{\sqrt{T}}\sum_{t=2}^{T}\boldsymbol{X}_{t,K}(\tau_1,\tau_2)+o_p(1),\\
\sqrt{T}\hat{\boldsymbol{\gamma}}_{K,j,l} &= \frac{1}{\sqrt{T}}\sum_{t=2}^{T}\boldsymbol{X}_{t,K,j,l}+o_p(1).
\end{aligned}$$

Lemma A.1. *Under Assumptions 1 and 2, as $T\to\infty$, we have*

$$\sqrt{T}\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2)\xrightarrow{d}\boldsymbol{\Gamma}_K(\tau_1,\tau_2),\quad \tau_1,\tau_2\in[0,1],$$

where $\boldsymbol{\Gamma}_K(\tau_1,\tau_2)=\big(\Gamma_1(\tau_1,\tau_2),\ldots,\Gamma_K(\tau_1,\tau_2)\big)^{\mathrm{T}}$ is a $K\times 1$ vector-valued mean-zero Gaussian process in $\mathbb{H}_1$, whose covariance structure is given in (5).

Proof of Lemma A.1. This lemma can be derived from the following two conditions:

(A.i). Finite-dimensional convergence of the sequence $\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2)$. According to Theorem A.1 in Aue et al. (2009), to show that the process $\sqrt{T}\hat{\gamma}_{K,j,l}$ converges to a multivariate normal distribution in $\mathbb{R}^K$, it suffices to show that the sequence $\{\boldsymbol{X}_{t,K,j,l}\}$ is L^2-m-approximable

in $\mathbb{R}^K$. This condition is satisfied if the sequence $\{\boldsymbol{X}_{t,K}\}$ is L^2-m-approximable in the Hilbert space $\mathbb{H}_1$.

(A.ii). The tightness of the sequence $\hat{\gamma}_K(\tau_1,\tau_2)$ in $\mathbb{H}_1$. Following the Lemma 6.1 in Zhang (2016), it is sufficient to demonstrate the tightness of the sequence $\sqrt{T}\hat{\boldsymbol{\gamma}}_{h,j,l}$ for each $1 \leq h \leq K$ and for each $1 \leq j,l < \infty$.

We begin by proving that the sequence $\{\boldsymbol{X}_{t,K}\}$ is L^2-m-approximable in $\mathbb{H}_1$. This is equivalent to demonstrating the L^2-m-approximability of the following sequence:

$$\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2) := (X_t(\tau_1)X_{t-1}(\tau_2),\ldots,X_t(\tau_1)X_{t-K}(\tau_2))^{\mathrm{T}}$$

in $\mathbb{H}_1$, since the difference of $\boldsymbol{X}_{t,K}$ and $\widetilde{\boldsymbol{X}}_{t,K}$ is only a constant vector.

It follows from the assumption that the sequence $\{\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2)\}$ is strictly stationary. Using the Cauchy-Schwarz inequality and the assumption of L^4-m-approximability, we have:

$$\begin{aligned}
\mathrm{E}\iint\Big\{\widetilde{\boldsymbol{X}}_{t,K}^{\mathrm{T}}(\tau_1,\tau_2)\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2)\Big\}d\tau_1 d\tau_2 &= \sum_{h=1}^{K}\mathrm{E}\iint\Big\{X_t(\tau_1)X_{t-h}(\tau_2)\Big\}^2 d\tau_1 d\tau_2 \\
&\leq \sum_{h=1}^{K}\mathrm{E}\Big\{\int X_t^2(\tau_1)d\tau_1\Big\}\Big\{\int X_{t-h}^2(\tau_2)d\tau_2\Big\} \\
&\leq \sum_{h=1}^{K}\big(\mathrm{E}\,\|X_t\|^4\big)^{1/2}\big(\mathrm{E}\,\|X_{t-h}\|^4\big)^{1/2} \\
&= K\,\mathrm{E}\,\|X_t\|^4 < \infty.
\end{aligned}$$

Therefore, $\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2)$ is almost surely an element of $\mathbb{H}_1$.

Furthermore, by Assumption 1, we have:

$$\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2) = f(\varepsilon_t,\varepsilon_{t-1},\ldots),$$

for some measurable function $f : S^{\infty} \mapsto \mathbb{H}_1$. Let $\widetilde{\mathbf{X}}_{t,K}^{(m)}$ be defined as in (2.6), such that when $m > K$,

$$\widetilde{\boldsymbol{X}}_{t,K}^{(m)}(\tau_1,\tau_2) = \big(X_t^{(m)}(\tau_1)X_{t-1}^{(m-1)}(\tau_2),\ldots,X_t^{(m)}(\tau_1)X_{t-K}^{(m-K)}(\tau_2)\big)^{\mathrm{T}}.$$

Applying the triangle inequality in $L^2\big([0,1]^2\big)$, we have that for $m > K$,

$$\begin{aligned}
&\big(\mathrm{E}\,\|\widetilde{\boldsymbol{X}}_{t,K} - \widetilde{\boldsymbol{X}}_{t,K}^{(m)}\|_{\mathbb{H}_1}^2\big)^{1/2}\\
=&\Big[\mathrm{E}\iint\Big\{\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2) - \widetilde{\boldsymbol{X}}_{t,K}^{(m)}(\tau_1,\tau_2)\Big\}^{\mathrm{T}}\Big\{\widetilde{\boldsymbol{X}}_{t,K}(\tau_1,\tau_2) - \widetilde{\boldsymbol{X}}_{t,K}^{(m)}(\tau_1,\tau_2)\Big\}d\tau_1 d\tau_2\Big]^{1/2}\\
=&\Big\{\sum_{h=1}^{K}\mathrm{E}\,\big\|X_t(\tau_1)X_{t-h}(\tau_2) - X_t^{(m)}(\tau_1)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\Big\}^{1/2}\\
=&\Big\{\sum_{h=1}^{K}\mathrm{E}\,\big\|X_t(\tau_1)\big(X_{t-h}(\tau_2) - X_{t-h}^{(m-h)}(\tau_2)\big) + \big(X_t(\tau_1) - X_t^{(m)}(\tau_1)\big)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\Big\}^{1/2}\\
\le&\sum_{h=1}^{K}\Big[2\,\mathrm{E}\Big\{\big\|X_t(\tau_1)X_{t-h}(\tau_2) - X_t(\tau_1)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\\
&+\big\|X_t(\tau_1)X_{t-h}^{(m-h)}(\tau_2) - X_t^{(m)}(\tau_1)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\Big\}\Big]^{1/2}\\
\le&\sqrt{2}\sum_{h=1}^{K}\Big[\Big\{\mathrm{E}\,\big\|X_t(\tau_1)X_{t-h}(\tau_2) - X_t(\tau_1)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\Big\}^{1/2}\\
&+\Big\{\mathrm{E}\,\big\|X_t(\tau_1)X_{t-h}^{(m-h)}(\tau_2) - X_t^{(m)}(\tau_1)X_{t-h}^{(m-h)}(\tau_2)\big\|_{[0,1]^2}^2\Big\}^{1/2}\Big]\\
\equiv&\sqrt{2}\sum_{h=1}^{K}(J_1+J_2),
\end{aligned}\tag{1}$$

where $\|\cdot\|_{[0,1]^2}$ denotes the norm in $L^2\big([0,1]^2\big)$.

By the Fubini theorem and the Cauchy-Schwarz inequality, we obtain:

$$J_2 = \big(\mathrm{E}\,\|X_{t-h}^{(m-h)}\|^2\|X_t - X_t^{(m)}\|^2\big)^{1/2} \le \big(\mathrm{E}\,\|X_{t-h}\|^4\big)^{1/4}\big(\mathrm{E}\,\|X_t - X_t^{(m)}\|^4\big)^{1/4}.\tag{2}$$

Similarly, we have:

$$J_1 \leq \big(\mathrm{E}\,\|X_t\|^4\big)^{1/4}\big(\mathrm{E}\,\|X_{t-h} - X_{t-h}^{(m-h)}\|^4\big)^{1/4}. \tag{3}$$

Combining (1)-(3), we have:

$$\begin{aligned}\big(\mathrm{E}\,\|\widetilde{\boldsymbol{X}}_{t,K} - \widetilde{\boldsymbol{X}}_{t,K}^{(m)}\|_{\mathbb{H}_1}^2\big)^{1/2} \leq & \sqrt{2}\big(\mathrm{E}\,\|X_0\|^4\big)^{1/4}\sum_{h=1}^{K}\Big\{\big(\mathrm{E}\,\|X_0 - X_0^{(m-h)}\|^4\big)^{1/4} \\ & + \big(\mathrm{E}\,\|X_0 - X_0^{(m)}\|^4\big)^{1/4}\Big\}.\end{aligned}$$

By the approximability condition, we have $\mathrm{E}\,\|X_t\|^4 < \infty$. When K is fixed, it follows that:

$$\begin{aligned}&\sum_{m=K+1}^{\infty}\big(\mathrm{E}\,\|\widetilde{\boldsymbol{X}}_{t,K} - \widetilde{\boldsymbol{X}}_{t,K}^{(m)}\|_{\mathbb{H}_1}^2\big)^{1/2} \\ \leq & \sqrt{2}\sum_{h=1}^{K}\big(\mathrm{E}\,\|X_0\|^4\big)^{1/4}\sum_{m=K+1}^{\infty}\Big\{\big(\mathrm{E}\,\|X_0 - X_0^{(m-h)}\|^4\big)^{1/4} + \big(\mathrm{E}\,\|X_0 - X_0^{(m)}\|^4\big)^{1/4}\Big\} \\ < & \infty,\end{aligned}$$

which establishes that the sequence $\{\widetilde{\boldsymbol{X}}_{t,K}\}$ is L^2-m-approximable in $\mathbb{H}_1$.

As a result, the process $\sqrt{T}\hat{\gamma}_{K,j,l}$ converges to a multivariate normal distribution in $\mathbb{R}^K$, thus establishing the finite-dimensional convergence in **(A.i)**.

Next, for **(A.ii)**, we need to show that for any $1 \leq j, l < \infty$, the sequence $\sqrt{T}\hat{\boldsymbol{\gamma}}_{K,j,l}$ is tight in $\mathbb{R}^K$. Following the approach outlined in Eq. (36) of Zhang (2016), it is sufficient to show that for $1 \leq h \leq K$,

$$\lim_{\max(N_1,N_2)\to\infty}\sup_T \frac{1}{T}\,\mathrm{E}\sum_{j\geq N_1, l\geq N_2}\Big[\sum_{t=h+1}^{T}\{X_{t,j}X_{t-h,l} - \mathrm{E}(X_{t,j}X_{t-h,l})\}\Big]^2 = 0. \tag{4}$$

Using the covariance structure, we have:

$$
\begin{aligned}
&\sup_T \frac{1}{T}\,\mathrm{E}\sum_{j\geq N_1,l\geq N_2}\Big[\sum_{t=h+1}^{T}\{X_{t,j}X_{t-h,l}-\mathrm{E}(X_{t,j}X_{t-h,l})\}\Big]^2\\
=&\sup_T \frac{1}{T}\sum_{j\geq N_1,l\geq N_2}\sum_{t=h+1}^{T}\sum_{t'=h+1}^{T}\mathrm{Cov}(X_{t,j}X_{t-h,l},X_{t',j}X_{t'-h,l})\\
=&\sup_T \frac{1}{T}\sum_{j\geq N_1,l\geq N_2}\sum_{t=h+1}^{T}\sum_{t'=h+1}^{T}\big\{\mathrm{Cum}(X_{t,j},X_{t-h,l},X_{t',j},X_{t'-h,l})+\mathrm{E}(X_{t,j}X_{t',j})\,\mathrm{E}(X_{t-h,l}X_{t'-h,l})\\
&+\mathrm{E}(X_{t,j}X_{t'-h,l})\,\mathrm{E}(X_{t-h,l}X_{t',j})\big\}\\
=&\sup_T \frac{1}{T}\sum_{j\geq N_1,l\geq N_2}\sum_{t=h+1}^{T}\sum_{t'=h+1}^{T}\big\{\langle\mathcal{R}_{t-t'+h,t-t',h}(u_j\otimes u_l),u_j\otimes u_l\rangle+\langle\gamma_{t-t'}u_j,u_j\rangle\langle\gamma_{t-t'}u_l,u_l\rangle\\
&+\langle\gamma_{t-t'+h}u_l,u_j\rangle\langle\gamma_{t-t'-h}u_j,u_l\rangle\big\}\\
\leq&\sum_{j\geq N_1,l\geq N_2}\sum_{s=-\infty}^{\infty}\big|\langle\mathcal{R}_{s+h,s,h}(u_j\otimes u_l),u_j\otimes u_l\rangle+\langle\gamma_s u_j,u_j\rangle\langle\gamma_s u_l,u_l\rangle+\langle\gamma_{s+h}u_l,u_j\rangle\langle\gamma_{s-h}u_j,u_l\rangle\big|.
\end{aligned}
$$

By the summability condition, we have:

$$
\sum_{s=-\infty}^{\infty}\sum_{j,l=1}^{\infty}\big|\langle\gamma_s u_j,u_j\rangle\langle\gamma_s u_l,u_l\rangle\big|=\sum_{s=-\infty}^{\infty}\|\gamma_s\|_{TR}^2<\infty,
$$

and by the Cauchy-Schwarz inequality,

$$
\begin{aligned}
\sum_{s=-\infty}^{\infty}\sum_{j,l=1}^{\infty}\big|\langle\gamma_{s+h}u_l,u_j\rangle\langle\gamma_{s-h}u_j,u_l\rangle\big|&\leq\sum_{s=-\infty}^{\infty}\Big(\sum_{j,l=1}^{\infty}|\langle\gamma_{s+h}u_l,u_j\rangle|^2\Big)^{1/2}\Big(\sum_{j,l=1}^{\infty}|\langle\gamma_{s+h}u_l,u_j\rangle|^2\Big)^{1/2}\\
&\leq\sum_{s=-\infty}^{\infty}\|\gamma_s\|_{\mathcal{S}}^2\leq\sum_{s=-\infty}^{\infty}\|\gamma_s\|_{TR}^2<\infty,
\end{aligned}
$$

$$
\sum_{s=-\infty}^{\infty}\sum_{j,l=1}^{\infty}\big|\langle\mathcal{R}_{s+h,s,h}(u_j\otimes u_l),u_j\otimes u_l\rangle\big|\leq\sum_{s=-\infty}^{\infty}\|\mathcal{R}_{s+h,s,h}\|_{TR}<\infty,
$$

where $\mathcal{R}_{l,r,p}$ is the 4th-order cumulant operator defined in (2.9).

Therefore, (4) holds, demonstrating that the sequence $\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2)$ is tight in $\mathbb{H}_1$. Combining the results from **(A.i)** and **(A.ii)**, it follows that $\sqrt{T}\hat{\boldsymbol{\gamma}}_K(\tau_1,\tau_2) \xrightarrow{d} \boldsymbol{\Gamma}_K(\tau_1,\tau_2),\ \tau_1,\tau_2 \in [0,1]$, with the cross-covariance operator between $\Gamma_i(\tau_1,\tau_2)$ and $\Gamma_j(\tau_1,\tau_2)$, for any $1 \le i,j \le K$, given by

$$
\begin{aligned}
(\Psi_{i,j}\phi)(\tau_1,\tau_2) &:= \sum_{s=-\infty}^{\infty} \iint \mathrm{Cov}\left(X_i(\tau_1)X_0(\tau_2), X_{j+s}(\tau_1')X_s(\tau_2')\right)\phi(\tau_1',\tau_2')d\tau_1'd\tau_2' \\
&= \iint \left[\psi_K(\tau_1,\tau_2,\tau_1',\tau_2')\right]_{ij}\phi(\tau_1',\tau_2')d\tau_1'd\tau_2', \qquad (5)
\end{aligned}
$$

for any $\phi(\tau_1,\tau_2) \in L^2\big([0,1]^2\big)$. The $K \times K$ matrix $\psi_K(\tau_1,\tau_2,\tau_1',\tau_2')$ is the covariance kernel function of $\boldsymbol{\Gamma}_K(\tau_1,\tau_2)$ and its (i,j)-th element is implicitly defined.

The proof of Lemma A.1 is complete. ■

Proof of Theorem 1. The covariance operator of $\boldsymbol{\Gamma}_K(\tau_1,\tau_2)$ given by Lemma A.1, denoted by $\Psi_K : \mathbb{H}_1 \mapsto \mathbb{H}_1$, is induced by the kernel ψ_K, which takes the following form:

$$
\Psi_K(\tilde{\phi})(\tau_1,\tau_2) = \iint \psi_K(\tau_1,\tau_2,\tau_1',\tau_2')\tilde{\phi}(\tau_1',\tau_2')d\tau_1'd\tau_2', \qquad (6)
$$

where $\tilde{\phi}(\tau_1',\tau_2') \in \mathbb{H}_1$.

Following the proof of Kokoszka et al. (2017), the operator Ψ_K is Hilbert-Schmidt, and thus compact, symmetric, and positive definite. Consequently, by Mercer's theorem, there exists non-negative eigenvalues $\{\xi_{K,l},\ 1 \le l < \infty\}$ and a corresponding collection of orthonormal eigenfunctions $\{\varphi_{K,l}(\tau_1,\tau_2), 1 \le l < \infty, 0 \le \tau_1,\tau_2 \le 1\}$, such that

$$
\Psi_K(\varphi_{K,l})(\tau_1,\tau_2) = \iint \psi_K(\tau_1,\tau_2,\tau_1',\tau_2')\varphi_{K,l}(\tau_1',\tau_2')d\tau_1'd\tau_2' = \xi_{K,l}\varphi_{K,l}(\tau_1,\tau_2).
$$

By the Karhunen-Loéve expansion,

$$\mathbf{\Gamma}_K(\tau_1,\tau_2)=\sum_{l=1}^{\infty}\xi_{K,l}^{1/2}\mathcal{N}_l\varphi_{K,l}(\tau_1,\tau_2),$$

where $\{\mathcal{N}_l\}_{l=1}^{\infty}$ are IID standard normal random variables. From Lemma A.1 and the continuous mapping theorem, it follows that, when $T\to\infty$,

$$T\sum_{h=1}^{K}\|\hat{\gamma}_h\|^2\xrightarrow{d}\sum_{l=1}^{\infty}\xi_{K,l}\mathcal{N}_l^2.$$

Finally, since $\hat{\rho}_h=\dfrac{\|\hat{\gamma}_h\|}{\int\hat{\gamma}_0(\tau,\tau)d\tau}$ and $\int\hat{\gamma}_0(\tau,\tau)d\tau\xrightarrow{p}\int \mathrm{E}(X_0^2(t))dt$, it follows from Slutsky's lemma that

$$T\sum_{h=1}^{K}\hat{\rho}_h^2\xrightarrow{d}\frac{\sum_{l=1}^{\infty}\xi_{K,l}\mathcal{N}_l^2}{\left\{\int \mathrm{E}(X_0^2(t))dt\right\}^2}.$$

This completes the proof of Theorem 1. ■

Proof of Theorem 2. Since $V_{T,K}\geq Q_{T,h}$ for all $h\in\{1,\ldots,K\}$ and the denominator of $Q_{T,h}$ is finite, it follows that it is enough to show that, under the conditions of the theorem, $T\|\hat{\gamma}_h\|^2\xrightarrow{p}\infty$ as $T\to\infty$. Simple algebra yields that

$$\begin{aligned}
T\|\hat{\gamma}_h\|^2&=\frac{1}{T}\iint\Big[\sum_{t=1+h}^{T}\big\{X_t(\tau_1)X_{t-h}(\tau_2)-\mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\big\}\Big]^2d\tau_1d\tau_2\\
&=\iint\Big[\frac{1}{\sqrt{T}}\sum_{t=1+h}^{T}\big\{X_t(\tau_1)X_{t-h}(\tau_2)-\mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\big\}\Big]^2d\tau_1d\tau_2\\
&\quad+2\iint\Big[\frac{T-h}{T}\mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\sum_{t=1+h}^{T}\big\{X_t(\tau_1)X_{t-h}(\tau_2)-\mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\big\}\Big]d\tau_1d\tau_2\\
&\quad+\frac{(T-h)^2}{T}\big\|\mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\big\|^2. \qquad (7)
\end{aligned}$$

By the arguments used to prove the condition **(A.i)** in Lemma A.1, the stationary sequence $\{X_t(\tau_1)X_{t-h}(\tau_2) - \mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\}$ is mean zero and L^2-m-approximable. From this we obtain that

$$\iint \Big[\frac{1}{\sqrt{T}} \sum_{t=1+h}^{T} \{X_t(\tau_1)X_{t-h}(\tau_2) - \mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\}\Big]^2 d\tau_1 d\tau_2 = O_p(1),$$

and

$$\iint \Big[\frac{T-h}{T} \mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right) \sum_{t=1+h}^{T} \{X_t(\tau_1)X_{t-h}(\tau_2) - \mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\}\Big] d\tau_1 d\tau_2 = O_p(\sqrt{T}).$$

The result then follows from (7) since $\frac{(T-h)^2}{T} \big\| \mathrm{E}\left(X_h(\tau_1)X_0(\tau_2)\right)\big\|^2$ diverges to infinity at the rate T. ■

To establish Theorem 3, it is sufficient to demonstrate the following lemma.

Lemma A.2. *Under Assumptions 1, 3 and 4, when $T \to \infty$, we have*

$$d\Big[\mathcal{L}\Big\{\big(\sqrt{T}\hat{\gamma}_1^*(\tau_1,\tau_2),\ldots,\sqrt{T}\hat{\gamma}_K^*(\tau_1,\tau_2)\big)^{\mathrm{T}} \big| \mathbb{X}_T\Big\}, \mathcal{L}\Big\{\big(\Gamma_1(\tau_1,\tau_2),\ldots,\Gamma_K(\tau_1,\tau_2)\big)^{\mathrm{T}}\Big\}\Big] \to 0,$$

in probability, where $\mathbf{\Gamma}_K(\tau_1,\tau_2) = \big(\Gamma_1(\tau_1,\tau_2),\ldots,\Gamma_K(\tau_1,\tau_2)\big)^{\mathrm{T}}$ is a $K \times 1$ vector-valued mean-zero Gaussian process in $\mathbb{H}_1$, whose covariance structure is given in (5).

Proof of Lemma A.2. To begin, we define the following random weighted quantities:

$$\begin{aligned}
\widehat{\boldsymbol{X}}_{t,K}^* &= \Big(w_t\big\{X_t(\tau_1)X_{t-1}(\tau_2) - \hat{\gamma}_1(\tau_1,\tau_2)\big\},\ldots,w_t\big\{X_t(\tau_1)X_{t-K}(\tau_2) - \hat{\gamma}_K(\tau_1,\tau_2)\big\}\Big)^{\mathrm{T}},\\
\widehat{\boldsymbol{X}}_{t,K,j,l}^* &= \Big(w_t\big(X_{t,j}X_{t-1,l} - \langle\hat{\gamma}_1 u_l, u_j\rangle\big),\ldots,w_t\big(X_{t,j}X_{t-K,l} - \langle\hat{\gamma}_K u_l, u_j\rangle\big)\Big)^{\mathrm{T}},\\
\boldsymbol{X}_{t,K,j,l}^* &= \Big(w_t\big(X_{t,j}X_{t-1,l} - \langle\gamma_1 u_l, u_j\rangle\big),\ldots,w_t\big(X_{t,j}X_{t-K,l} - \langle\gamma_K u_l, u_j\rangle\big)\Big)^{\mathrm{T}},
\end{aligned}$$

and their corresponding h-th elements are denoted respectively by $\widehat{\boldsymbol{X}}^*_{t,(h)}$, $\widehat{\boldsymbol{X}}^*_{t,(h),j,l}$, $\boldsymbol{X}^*_{t,(h),j,l}$.

Let E^*, Var^* denote the conditional expectation and variance given the original sample. To prove Lemma A.2, similarly to Lemma A.1, we need to show that, conditional on the original sample $\{X_t\}_{t=1}^T$, the following two conditions hold:

(A.iii). Finite dimensional convergence of the sequence $\big(\hat{\gamma}^*_1(\tau_1,\tau_2),\ldots,\hat{\gamma}^*_K(\tau_1,\tau_2)\big)^{\mathrm{T}}$**.**

Since

$$\big(\sqrt{T}\hat{\gamma}^*_1(\tau_1,\tau_2),\ldots,\sqrt{T}\hat{\gamma}^*_K(\tau_1,\tau_2)\big)^{\mathrm{T}}=\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\widehat{\boldsymbol{X}}^*_{t,K}+o_p(1),$$

it suffices to establish the CLT for the sequence $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\widehat{\boldsymbol{X}}^*_{t,K}$.

(A.iv). The tightness of the sequence $\big(\hat{\gamma}^*_1(\tau_1,\tau_2),\ldots,\hat{\gamma}^*_K(\tau_1,\tau_2)\big)^{\mathrm{T}}$**.**

We begin by proving **(A.iii)**. To establish the finite-dimensional CLT of $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\widehat{\boldsymbol{X}}^*_{t,K}$, it suffices to show the CLT for the sequence $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\widehat{\boldsymbol{X}}^*_{t,K,j,l}$. By the same argument as in the proof of Theorem 1, $\{\boldsymbol{X}^*_{t,K,j,l}\}_{t=2}^{\infty}$ is an L^2-m-approximable process. Thus, $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\boldsymbol{X}^*_{t,K,j,l}$ converges to a multivariate normal distribution.

Next, we will calculate the asymptotic covariance matrix of $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\boldsymbol{X}^*_{t,K,j,l}$.

For any

$$\boldsymbol{V}_K:=\big(v_1(\tau_1,\tau_2),v_2(\tau_1,\tau_2),\ldots,v_K(\tau_1,\tau_2)\big)^{\mathrm{T}}\in\mathbb{H}_1,$$

define $\boldsymbol{V}_{K,j,l}=(v_{1,j,l},v_{2,j,l},\ldots,v_{K,j,l})^{\mathrm{T}}\in\mathbb{R}^K$, where $v_{h,j,l}=\langle v_h(\tau_1,\tau_2),u_j\otimes u_l\rangle$, $1\le h\le K$. The calculation of the asymptotic covariance matrix of $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\boldsymbol{X}^*_{t,K,j,l}$ is thus transformed to determining the asymptotic variance of $\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle\boldsymbol{X}^*_{t,K,j,l},\boldsymbol{V}_{K,j,l}\rangle$.

Note that

$$\begin{aligned}\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle \boldsymbol{X}^*_{t,K,j,l}, \boldsymbol{V}_{K,j,l}\rangle &= \frac{1}{\sqrt{T}}\sum_{t=2}^{T}\sum_{h=1}^{K}\boldsymbol{X}^*_{t,(h),j,l}v_{h,j,l}\\ &= \frac{1}{\sqrt{T}}\sum_{t=2}^{K+1}\Big(\sum_{h=1}^{(t-1)\wedge K}\boldsymbol{X}^*_{t,(h),j,l}v_{h,j,l}\Big) + \frac{1}{\sqrt{T}}\sum_{t=K+2}^{T}\Big(\sum_{h=1}^{(t-1)\wedge K}\boldsymbol{X}^*_{t,(h),j,l}v_{h,j,l}\Big) + o_p(1)\\ &:= \frac{1}{\sqrt{T}}\sum_{t=2}^{K+1}M^*_{t,K} + \frac{1}{\sqrt{T}}\sum_{t=K+2}^{T}M^*_{t,K} + o_p(1),\end{aligned}$$

where $\mathrm{E}\big[\mathrm{Var}^*(\frac{1}{\sqrt{T}}\sum_{t=2}^{K+1}M^*_{t,K})\big] = o(1)$, since this term only involves a finite number of terms. Thus, it suffices to show the asymptotic normality of $\frac{1}{\sqrt{T}}\sum_{t=K+2}^{T}M^*_{t,K}$.

We can write

$$\begin{aligned}J^*_{T,K} := \frac{1}{\sqrt{T}}\sum_{t=K+2}^{T}M^*_{t,K} &= \frac{1}{\sqrt{T}}\sum_{t=K+2}^{T}\sum_{h=1}^{K}w_t\big(X_{t,j}X_{t-h,l} - \langle\gamma_h u_l, u_j\rangle\big)v_{h,j,l}\\ &= \sum_{s=1}^{L_T}\frac{1}{\sqrt{T}}\delta_s\sum_{t\in B_s\cap[K+2,T]}\sum_{h=1}^{K}\big(X_{t,j}X_{t-h,l} - \langle\gamma_h u_l, u_j\rangle\big)v_{h,j,l}.\end{aligned}$$

Then, since δ_s, $s = 1,\ldots,L_T$ has mean 0 and variance 1, we have

$$\mathrm{Var}^*(J^*_{T,K}) = \frac{1}{T}\sum_{s=1}^{L_T}\Big\{\sum_{t\in B_s\cap[K+2,T]}\sum_{h=1}^{K}\big(X_{t,j}X_{t-h,l} - \langle\gamma_h u_l, u_j\rangle\big)v_{h,j,l}\Big\}^2.$$

In the following, we shall show that, when $T\to\infty$,

$$\mathrm{Var}^*(J^*_{T,K}) \xrightarrow{p} \sum_{h,h'=1}^{K}v_{h,j,l}v_{h',j,l}\big\langle\Psi_{h,h'}(u_j\otimes u_l), u_j\otimes u_l\big\rangle.$$

To this end, we calculate $\mathrm{E}\big\{\mathrm{Var}^*(J^*_{T,K})\big\}$ and $\mathrm{Var}\big\{\mathrm{Var}^*(J^*_{T,K})\big\}$ accordingly.

We begin by calculating $\mathrm{E}\big\{\mathrm{Var}^*(J^*_{T,K})\big\}$ as follows:

$$
\begin{aligned}
&\mathrm{E}\big[\mathrm{Var}^*(J^*_{T,K})\big] = \frac{1}{T}\sum_{s=1}^{L_T}\sum_{t,t'\in B_s\cap[K+2,T]}\sum_{h,h'=1}^{K}\mathrm{Cov}(X_{t,j}X_{t-h,l},X_{t',j}X_{t'-h',l})v_{h,j,l}v_{h',j,l}\\
=&\frac{1}{T}\sum_{s=1}^{L_T}\sum_{h,h'=1}^{K}v_{h,j,l}v_{h',j,l}\sum_{t\in B_s\cap[K+2,T],t\geq h+1}\sum_{t'\in B_s\cap[K+2,T],t'\geq h'+1}\mathrm{Cov}(X_{t,j}X_{t-h,l},X_{t',j}X_{t'-h',l})\\
\to&\sum_{h,h'=1}^{K}v_{h,j,l}v_{h',j,l}\sum_{s=-\infty}^{\infty}\mathrm{Cov}(X_{h,j}X_{0,l},X_{s+h',j}X_{s,l})\\
=&\sum_{h,h'=1}^{K}v_{h,j,l}v_{h',j,l}\sum_{s=-\infty}^{\infty}\mathrm{Cov}\big(\langle X_h(\tau_1)X_0(\tau_2),u_j\otimes u_l(\tau_1,\tau_2)\rangle,\langle X_{s+h'}(\tau_1')X_s(\tau_2'),u_j\otimes u_l(\tau_1',\tau_2')\rangle\big)\\
=&\Big\langle\int\sum_{s=-\infty}^{\infty}\mathrm{Cov}\big(X_h(\tau_1)X_0(\tau_2),X_{s+h'}(\tau_1')X_s(\tau_2')\big)\big(u_j\otimes u_l(\tau_1',\tau_2')\big)d\tau_1'd\tau_2',u_j\otimes u_l(\tau_1,\tau_2)\Big\rangle\\
=&\sum_{h,h'=1}^{K}v_{h,j,l}v_{h',j,l}\big\langle\Psi_{h,h'}(u_j\otimes u_l),u_j\otimes u_l\big\rangle.
\end{aligned}
$$

Then, we will show that $\mathrm{Var}\big\{\mathrm{Var}^*(J^*_{T,K})\big\}=o(1)$.

Note that

$$
\begin{aligned}
&\mathrm{Var}\big[\mathrm{Var}^*(J^*_{T,K})\big]\\
=&\frac{1}{T^2}\sum_{s,s'=1}^{L_T}\sum_{h_1,h_2=1}^{K}\sum_{h_1',h_2'=1}^{K}v_{h_1,j,l}v_{h_2,j,l}v_{h_1',j,l}v_{h_2',j,l}\sum_{t_1,t_2\in B_s\cap[K+2,T]}\sum_{t_1',t_2'\in B_{s'}\cap[K+2,T]}\\
&\times\mathrm{Cov}(\boldsymbol{X}_{t_1,(h_1),j,l}\boldsymbol{X}_{t_2,(h_2),j,l},\boldsymbol{X}_{t_1',(h_1'),j,l}\boldsymbol{X}_{t_2',(h_2'),j,l}\\
=&\frac{1}{T^2}\sum_{s,s'=1}^{L_T}\sum_{h_1,h_2=1}^{K}\sum_{h_1',h_2'=1}^{K}v_{h_1,j,l}v_{h_2,j,l}v_{h_1',j,l}v_{h_2',j,l}\sum_{t_1,t_2\in B_s\cap[K+2,T]}\sum_{t_1',t_2'\in B_{s'}\cap[K+2,T]}\\
&\times\Big\{\mathrm{Cum}(\boldsymbol{X}_{t_1,(h_1),j,l},\boldsymbol{X}_{t_2,(h_2),j,l},\boldsymbol{X}_{t_1',(h_1'),j,l},\boldsymbol{X}_{t_2',(h_2'),j,l})+\mathrm{Cov}(\boldsymbol{X}_{t_1,(h_1),j,l},\boldsymbol{X}_{t_1',(h_1'),j,l})\\
&\times\mathrm{Cov}(\boldsymbol{X}_{t_2,(h_2),j,l},\boldsymbol{X}_{t_2',(h_2'),j,l})+\mathrm{Cov}(\boldsymbol{X}_{t_1,(h_1),j,l},\boldsymbol{X}_{t_2',(h_2'),j,l})\,\mathrm{Cov}(\boldsymbol{X}_{t_2,(h_2),j,l},\boldsymbol{X}_{t_1',(h_1'),j,l})\Big\}\\
=&\frac{1}{T^2}\sum_{s,s'=1}^{L_T}\sum_{h_1,h_2=1}^{K}\sum_{h_1',h_2'=1}^{K}v_{h_1,j,l}v_{h_2,j,l}v_{h_1',j,l}v_{h_2',j,l}\sum_{t_1,t_2\in B_s\cap[K+2,T]}\sum_{t_1',t_2'\in B_{s'}\cap[K+2,T]}(I_{1,l}+I_{2,l}+I_{3,l}).
\end{aligned}
\tag{8}
$$

We now proceed to address $I_{i,l}$, $i = 1, 2, 3$, respectively. By applying Lemma F.9 in Panaretos and Tavakoli (2013), Theorem II.2 in Rosenblatt (1985), and utilizing the triangle inequality, we obtain that

$$
\begin{aligned}
|I_{1,l}| &= \left| \operatorname{Cum}(X_{t_1,j} X_{t_1-h_1,l} X_{t_2,j} X_{t_2-h_2,l}, X_{t_1',j} X_{t_1'-h_1',l} X_{t_2',j} X_{t_2'-h_2',l}) \right| \\
&\leq \left\| \operatorname{Cum}(X_{t_1} X_{t_1-h_1} X_{t_2} X_{t_2-h_2}, X_{t_1'} X_{t_1'-h_1'} X_{t_2'} X_{t_2'-h_2'}) \right\|_{[0,1]^8} \\
&\leq \sum_{\lambda=\lambda_1 \cup \cdots \cup \lambda_p} \left\| \operatorname{Cum}(X_{\varsigma_1} : \varsigma_1 \in \lambda_1) \cdots \operatorname{Cum}(X_{\varsigma_p} : \varsigma_p \in \lambda_p) \right\|_{[0,1]^8} \\
&\leq \sum_{\lambda=\lambda_1 \cup \cdots \cup \lambda_p} \left\| \operatorname{Cum}(X_{\varsigma_1} : \varsigma_1 \in \lambda_1) \right\|_{[0,1]^{|\lambda_1|}} \cdots \left\| \operatorname{Cum}(X_{\varsigma_p} : \varsigma_p \in \lambda_p) \right\|_{[0,1]^{|\lambda_p|}},
\end{aligned}
$$

where $|\lambda_j|$ denotes the cardinality of the set λ_j and the summation is over all indecomposable partitions of the following two-way table:

$$
\begin{array}{ll}
t_1 & t_1 - h_1 \\
t_2 & t_2 - h_2 \\
t_1' & t_1' - h_1' \\
t_2' & t_2' - h_2'
\end{array}
$$

Under Assumption 4, it is straightforward to verify that its contribution to the sum (8) is of order $o(1)$. The arguments for $I_{2,l}$ and $I_{3,l}$ are analogous, with the only difference being the interchange of t_1' and t_2'.

Specifically, we can write $I_{2,l}$ as follows:

$$\begin{aligned}
I_{2,l} &= \mathrm{Cov}(X_{t_1,j}X_{t_1-h_1,l}, X_{t_1',j}X_{t_1'-h_1',l})\,\mathrm{Cov}(X_{t_2,j}X_{t_2-h_2,l}, X_{t_2',j}X_{t_2'-h_2',l}) \\
&= \Big\{\langle \mathcal{R}_{t_1-t_1'+h_1',t_1-t_1'-h_1+h_1',h_1'}(u_j\otimes u_l), u_j\otimes u_l\rangle + \langle \gamma_{t_1-t_1'}u_j, u_j\rangle\langle \gamma_{t_1-t_1'-h_1+h_1'}u_l, u_l\rangle \\
&\quad + \langle \gamma_{t_1-t_1'-h_1}u_j, u_l\rangle\langle \gamma_{t_1-t_1'+h_1'}u_l, u_j\rangle\Big\}\times \\
&\quad \Big\{\langle \mathcal{R}_{t_2-t_2'+h_2',t_2-t_2'-h_2+h_2',h_2'}(u_j\otimes u_l), u_j\otimes u_l\rangle + \langle \gamma_{t_2-t_2'}u_j, u_j\rangle\langle \gamma_{t_2-t_2'-h_2+h_2'}u_l, u_l\rangle \\
&\quad + \langle \gamma_{t_2-t_2'-h_2}u_j, u_l\rangle\langle \gamma_{t_2-t_2'+h_2'}u_l, u_j\rangle\Big\}.
\end{aligned}$$

When $s = s'$ in the summation of (8), the contribution of $I_{2,l}$ to $\mathrm{Var}\big[\mathrm{Var}^*(J^*_{T,K})\big]$ is $O(T^{-2}b_T) = o(1)$. In the case of $s \neq s'$, Assumption 4 implies that the magnitude of these terms is bounded by $CT^{-2}L_T^2 = o(1)$. Consequently, we have $\mathrm{Var}\big[\mathrm{Var}^*(J^*_{T,K})\big] = o(1)$.

As a result, when $T \to \infty$,

$$\mathrm{Var}^*\Big(\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle \boldsymbol{X}^*_{t,K,j,l}, \boldsymbol{V}_{K,j,l}\rangle\Big) \xrightarrow{p} \sum_{h,h'=1}^{K} v_{h,j,l}v_{h',j,l}\big\langle \Psi_{h,h'}(u_j\otimes u_l), u_j\otimes u_l\big\rangle. \tag{9}$$

Let $\widetilde{\boldsymbol{X}}^*_{t,K,j,l} = \widehat{\boldsymbol{X}}^*_{t,K,j,l} - \boldsymbol{X}^*_{t,K,j,l}$. When $T \to \infty$, we have

$$\mathrm{E}\Big\{\mathrm{Var}^*\Big(\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle \widetilde{\boldsymbol{X}}^*_{t,K,j,l}, \boldsymbol{V}_{K,j,l}\rangle\Big)\Big\} \xrightarrow{p} 0. \tag{10}$$

Combining the conclusions in (9) and (10), it is immediately obtained that

$$\mathrm{Var}^*\Big(\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle \widehat{\boldsymbol{X}}^*_{t,K,j,l}, \boldsymbol{V}_{K,j,l}\rangle\Big) \xrightarrow{p} \sum_{h,h'=1}^{K} v_{h,j,l}v_{h',j,l}\big\langle \Psi_{h,h'}(u_j\otimes u_l), u_j\otimes u_l\big\rangle,$$

which is equivalent to

$$\mathrm{Var}^*\Big(\frac{1}{\sqrt{T}}\sum_{t=2}^{T}\langle\widehat{\boldsymbol{X}}^*_{t,K},V_K\rangle_{\mathbb{H}_1}\Big)\xrightarrow{p}\langle\Psi_K(\boldsymbol{V}_K),\boldsymbol{V}_K\rangle_{\mathbb{H}_1},\quad T\to\infty.$$

The proof of **(A.iii)** is completed.

Next, we proceed to show **(A.iv)**, i.e., conditional on the sample, $\big\{\sqrt{T}\hat{\gamma}^*_h(\tau_1,\tau_2),1\le h\le K\big\}$ is tight in $\mathbb{H}_1$ in probability.

For $1\le h\le K$, we observe that

$$\begin{aligned}\sqrt{T}\hat{\gamma}^*_h(\tau_1,\tau_2)&=\frac{1}{\sqrt{T}}\sum_{t=h+1}^{T}w_t\big\{X_t(\tau_1)X_{t-h}(\tau_2)-\hat{\gamma}_h(\tau_1,\tau_2)\big\}\\&=L_T^{-1/2}\sum_{s=1}^{L_T}b_T^{-1/2}\delta_s\sum_{t\in B_s\cap[h+1,T]}\big\{X_t(\tau_1)X_{t-h}(\tau_2)-\hat{\gamma}_h(\tau_1,\tau_2)\big\}\\&:=L_T^{-1/2}\sum_{s=1}^{L_T}M^*_{sT}(\tau_1,\tau_2),\end{aligned}$$

where $M^*_{sT}(\tau_1,\tau_2)$ is implicitly defined. It is important to note that $M^*_{sT}(\tau_1,\tau_2)$ and $M^*_{s'T}(\tau_1,\tau_2)$, $s\neq s'$, are independent given the sample. In light of the argument in the proof of Theorem 4 of Escanciano and Velasco (2006) and Shao (2011), it suffices to verify that $\mathrm{E}^*\|M^*_{sT}(\tau_1,\tau_2)\|^2<\infty$ almost surely. To this end, following the analogous proof in Zhang (2016), we have $\mathrm{E}\big\{\mathrm{E}^*\|M^*_{sT}(\tau_1,\tau_2)\|^2\big\}$ $<\infty$.

By combining the conditions **(A.iii)** and **(A.iv)**, the proof of Lemma A.2 is complete. ■

Proof of Theorem 3. Following an argument similar to that of Theorem 1, and given the original sample, we directly establish the conditional distribution of $V^*_{K,T}$ as $T\to\infty$ in Theorem 3. ■

B. Additional Numerical Studies

In the following, we carry out some additional simulation studies to further investigate the influences of the parameters b_T and K on the testing performance. All the empirical rejection rates are average over 1000 Monte Carlo replicates following the same computing procedures used in Section 5. Bootstrap conducts $B = 500$ replicates.

Table 1: Empirical sizes in the percentage of BRWB test.
